

Question for written answer E-003483/2025
to the Commission
Rule 144
Piotr Müller (ECR)

Subject: Tripartite contracts in the energy sector – selection criteria, omission of biomethane and nuclear energy, and impact on industrial competitiveness

The Commission has announced new tripartite contracts in the energy sector, which are to bring together developers, energy-intensive industry and the public sector with the support of financial institutions.

The aim is to decrease energy costs and increase the attractiveness of investing in strategic sectors, starting with the offshore wind, grids and energy storage sectors.

In light of the above, I ask:

1. What criteria will determine the selection of sectors and projects that will receive support as part of these new tripartite contracts?
2. Why have biomethane and nuclear energy not been included among the first priorities despite their significance for energy security and stability of supply?
3. How is the Commission planning to ensure that tripartite contracts translate to tangible reductions in energy costs for EU industry, increasing its competitiveness in relation to the United States and China?
