Question for written answer E-003564/2025
to the Commission
Rule 144
Catherine Griset (PfE)

Subject: Development of AI to replace content moderators

TikTok recently announced that it was sacking several hundred of its content moderators in London. They will be replaced by AI.

Like fact-checking, content moderation on social media is an ‘Eldorado’ for far-left activists, who have made their passion into a career: they censor their conservative or sovereigntist political opponents as strictly as possible and earn money while doing so.

It certainly looks as though AI is set to replace these activists, putting an end to the manna from heaven that has fed them for so long – we advise them to find an honest living.

This shift will have to be monitored, of course, but it will be important to ensure that the AI systems doing the content moderation are not biased.

1. Given that the Commission already requires the major platforms to provide access to their algorithms, will it ensure that the AI systems in charge of content moderation are not influenced by far-left activists?

2. Can we expect the public to be provided with more information on how these moderation algorithms will be defined and by whom?
