

Question for written answer E-004408/2025
to the Commission
Rule 144
Galato Alexandraki (ECR)

Subject: Dangerous inactivity in the operation of the Cardiology Clinic of Kilgis Hospital

Despite the repeated appeals of the Director of the Cardiology Clinic and the unanimous opinions of the Scientific Council and the Medical Service, the central patient monitoring unit of the Coronary Unit of Kilgis Hospital has remained out of operation for a year. The equipment, essential for the continuous monitoring of patients with acute coronary syndromes, remains in storage unused, despite the existence of an available system that could be temporarily transferred from the ICU.

The unjustified delay in activating this equipment puts human lives at immediate risk and demonstrates serious dysfunctions in the administrative management of the hospital.

In view of the above:

1. How does the Commission assess the failure of the Greek authorities to ensure the basic functioning of a critical medical unit for an entire year?
2. Does the Commission intend to investigate whether this inaction constitutes a breach of the minimum standards of safety and quality of healthcare provided for in Directive 2011/24/EU?
3. What actions can the Commission take to ensure the immediate operational adequacy of the Cardiology Clinic of Kilgis Hospital?
