Question for written answer E-004536/2025
to the Commission
Rule 144
Moritz Körner (Renew)

Subject: Artificial general intelligence

Many experts anticipate that the development of so-called ‘Artificial general intelligence’ (AGI) – systems with cognitive skills at or above human level – could become a reality within the next five to ten years, i.e. by 2035.

A landmark technological development of this kind is likely to have far-reaching effects on the European labour market, public budgets and the EU’s economic competitiveness.

1. Is the Commission ruling out the possibility that AGI could be developed within the next ten years, and what is its assessment of the potential economic and social impact of such a development?

2. What legislative proposals is the Commission planning in order to provide effective support during the profound changes expected in the labour market and national budgets?

3. What is envisaged in the multiannual financial framework (MFF) until 2034 to mitigate the potential upheaval caused by the emergence of AGI?
