

**Question for written answer E-004659/2025/rev.1
to the Commission**
Rule 144
Galato Alexandraki (ECR)

Subject: Severe disparities in energy prices in Europe and significant burden on Greek households

The latest Eurostat data (from the first half of 2025) show large disparities in electricity and gas prices across Europe. While the price of electricity is EUR 6.2 per 100 kWh in Türkiye, the EU average stands at EUR 28.7. For natural gas, the average price in the EU is EUR 11.4 per 100 kWh (while in Türkiye, for example, it is EUR 2.1).

Prices in Greece are among the highest in Europe, with prices for electricity reaching EUR 31.4 per 100 kWh, while natural gas has soared to EUR 10.9 per 100 kWh, following an annual increase of around 15 %. The country is among the Member States with the highest costs in real terms, while subsidies in the previous period have been reduced. Energy poverty is worsening, with more and more households struggling to meet the basic costs of heating and electricity.

Can the Commission say:

1. How does it assess the growing disparities in energy prices in Europe and, in particular, the situation in Greece?
2. Will it propose uniform European price stabilisation tools to protect consumers?
