

**Question for written answer E-002988/2026/rev.1
to the Commission**
Rule 144
Moritz Körner (Renew)

Subject: Redispatching

In Germany, around 9.38 terawatt-hours (TWh) of electricity from renewable sources had to be curtailed due to redispatching interventions in 2025. Operators of the plants concerned received approximately EUR 434.5 million in financial compensation as a result.

1. What was the scale and cost of renewable energy curtailment in the other Member States? The Commission is asked to provide data on all Member States for 2025.
2. How does the Commission assess the scale of renewable energy curtailment and the associated compensation payments in Germany?
3. In the Commission's view, how is a system under which operators are also compensated for curtailed electricity and electricity not fed into the grid expected to create effective incentives to develop grid infrastructure as needed?
