

**Question for written answer E-003581/2026
to the Commission**
Rule 144
Galato Alexandraki (ECR)

Subject: Drinking water losses and funding for island water networks

The European Water Resilience Strategy aims to reduce leaks and modernise infrastructure. Under Article 4(3) of Directive 2020/2184 water leakage levels must be assessed and the results notified to the Commission by 12 January 2026.

For the Greek islands, we need to know how much water is being lost and prioritise repairing the networks. Small-scale suppliers also require technical assistance so that they can prepare and implement projects with the help of funding.

In view of the above, can the Commission answer the following:

1. Did Greece submit the assessment within the deadline? What are the results for the suppliers covered in the assessment, especially those who supply islands?
2. What Eu-funded projects are being implemented on the Greek islands to reduce leakages, what is the budget and what are the specific water saving targets?
3. How will it help small island suppliers record water loss and prepare investor-ready projects, even when they do not fulfil the Directive's minimum requirements for mandatory assessment?
